FLUSH-malli

Aalto-yliopistossa kehitetty laskennallinen malli ojitetujen pelloalueiden hydrologian kuvaamiseen

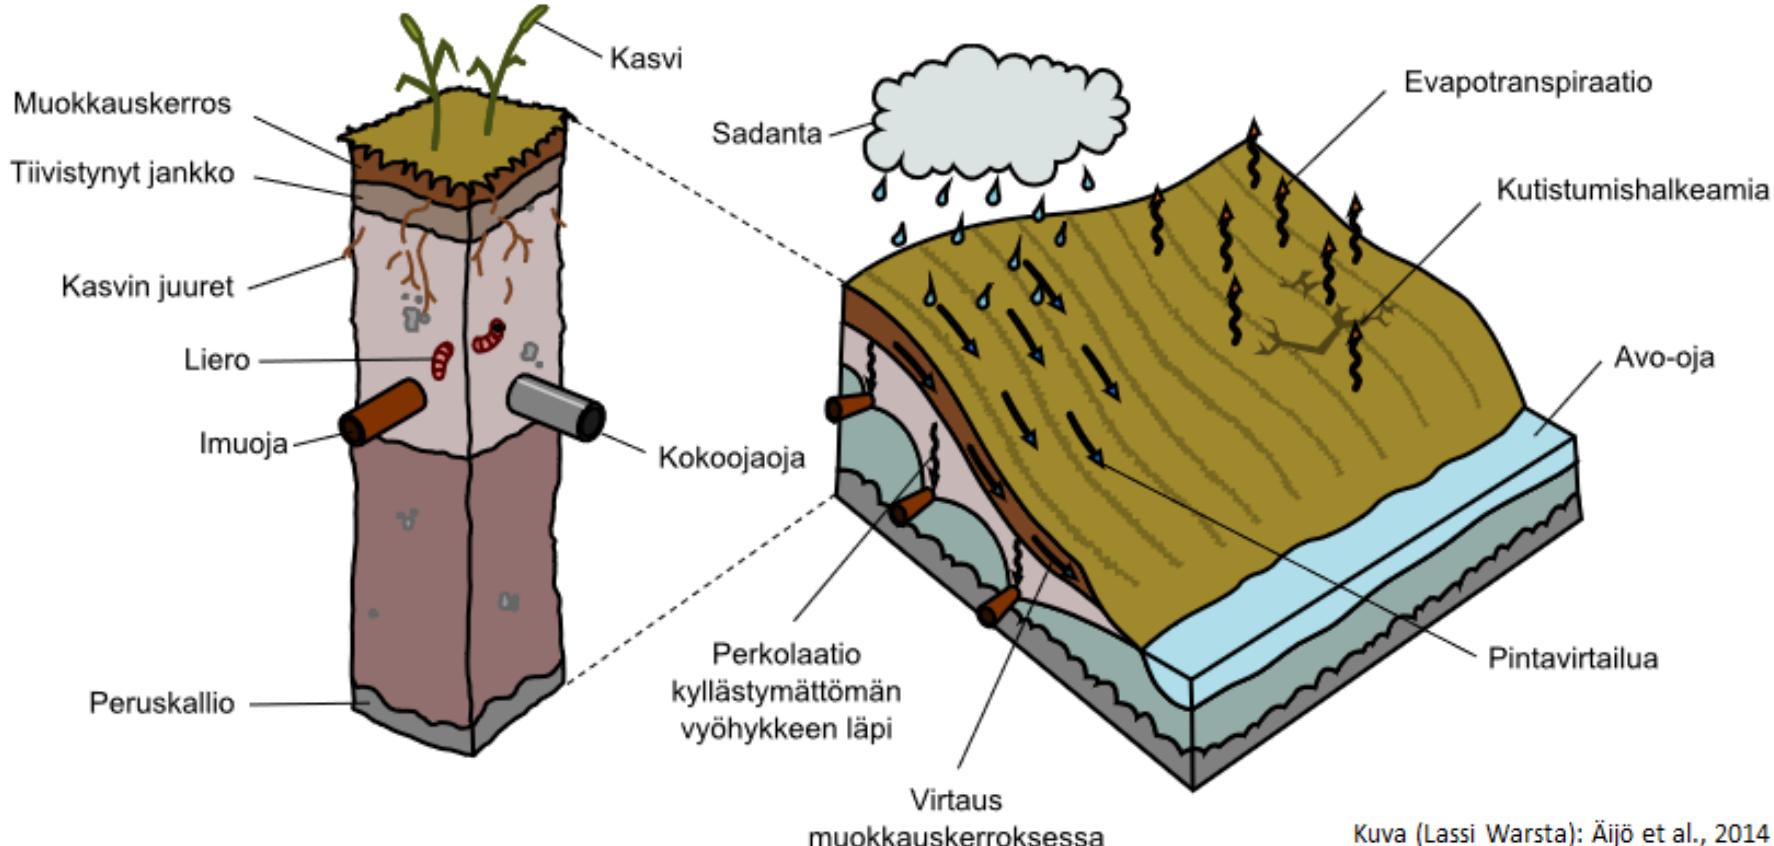

Mallille annetaan

Peltokuvaus:

- Topografia
- Maakerosten ominaisuudet
- Ojittussysteemi (salaojat, avo-ojat, säätösalaojitus)
- Juuristokerroksen paksuus (haihduntaa varten)

Meteorologinen kuvaus:

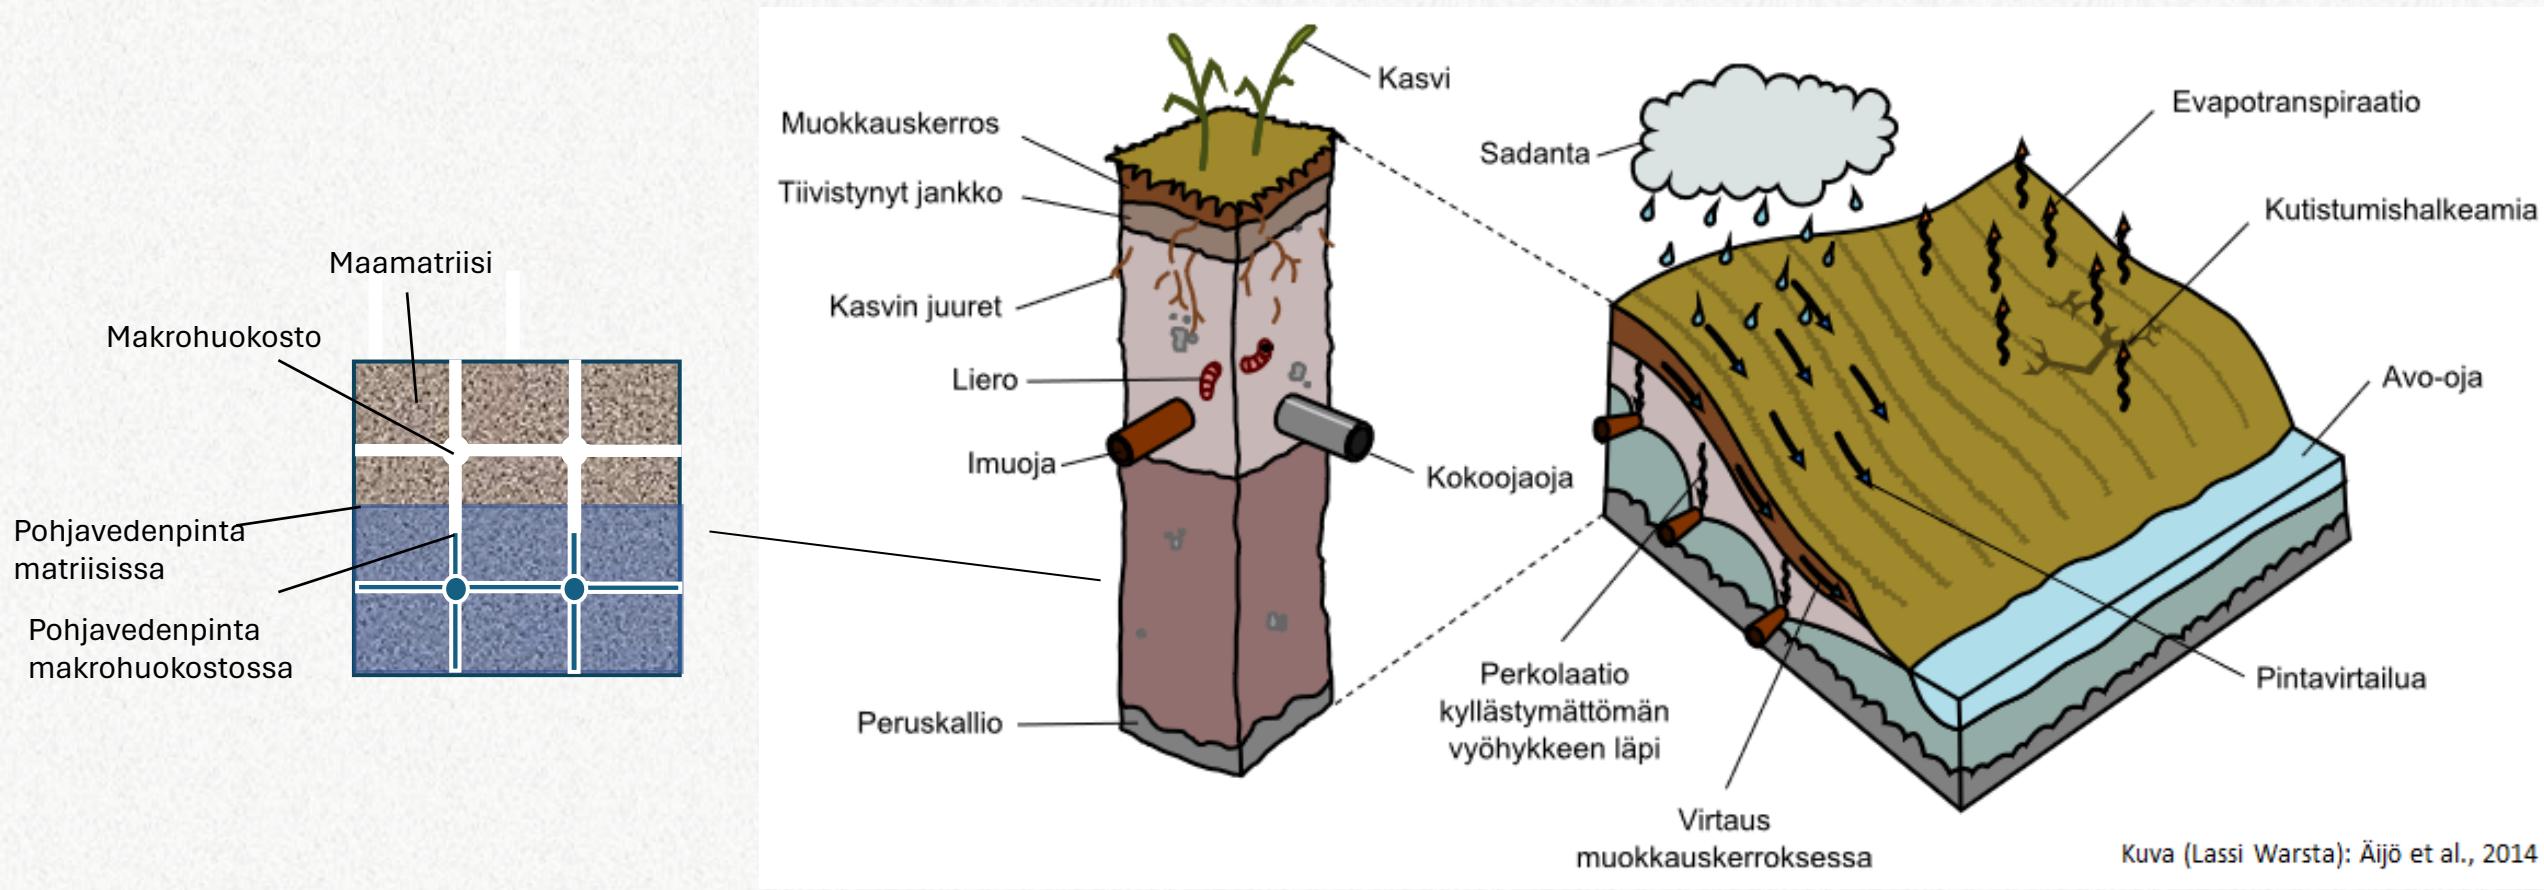

- Potentiaalinen haihduta
- Sadanta
- Lumiprosessit: lämpötila, säteilyenergia, tuulennopeus, suhteellinen kosteus

Kuva (Lassi Warsta): Äijö et al., 2014

FLUSH-malli

Aalto-yliopistossa kehitetty laskennallinen malli ojitetujen pelloalueiden hydrologian kuvaamiseen

MAATALOUDEN ALUEELLISEN VESIENHALLINNAN LASKENTA- ALUSTA

Application description

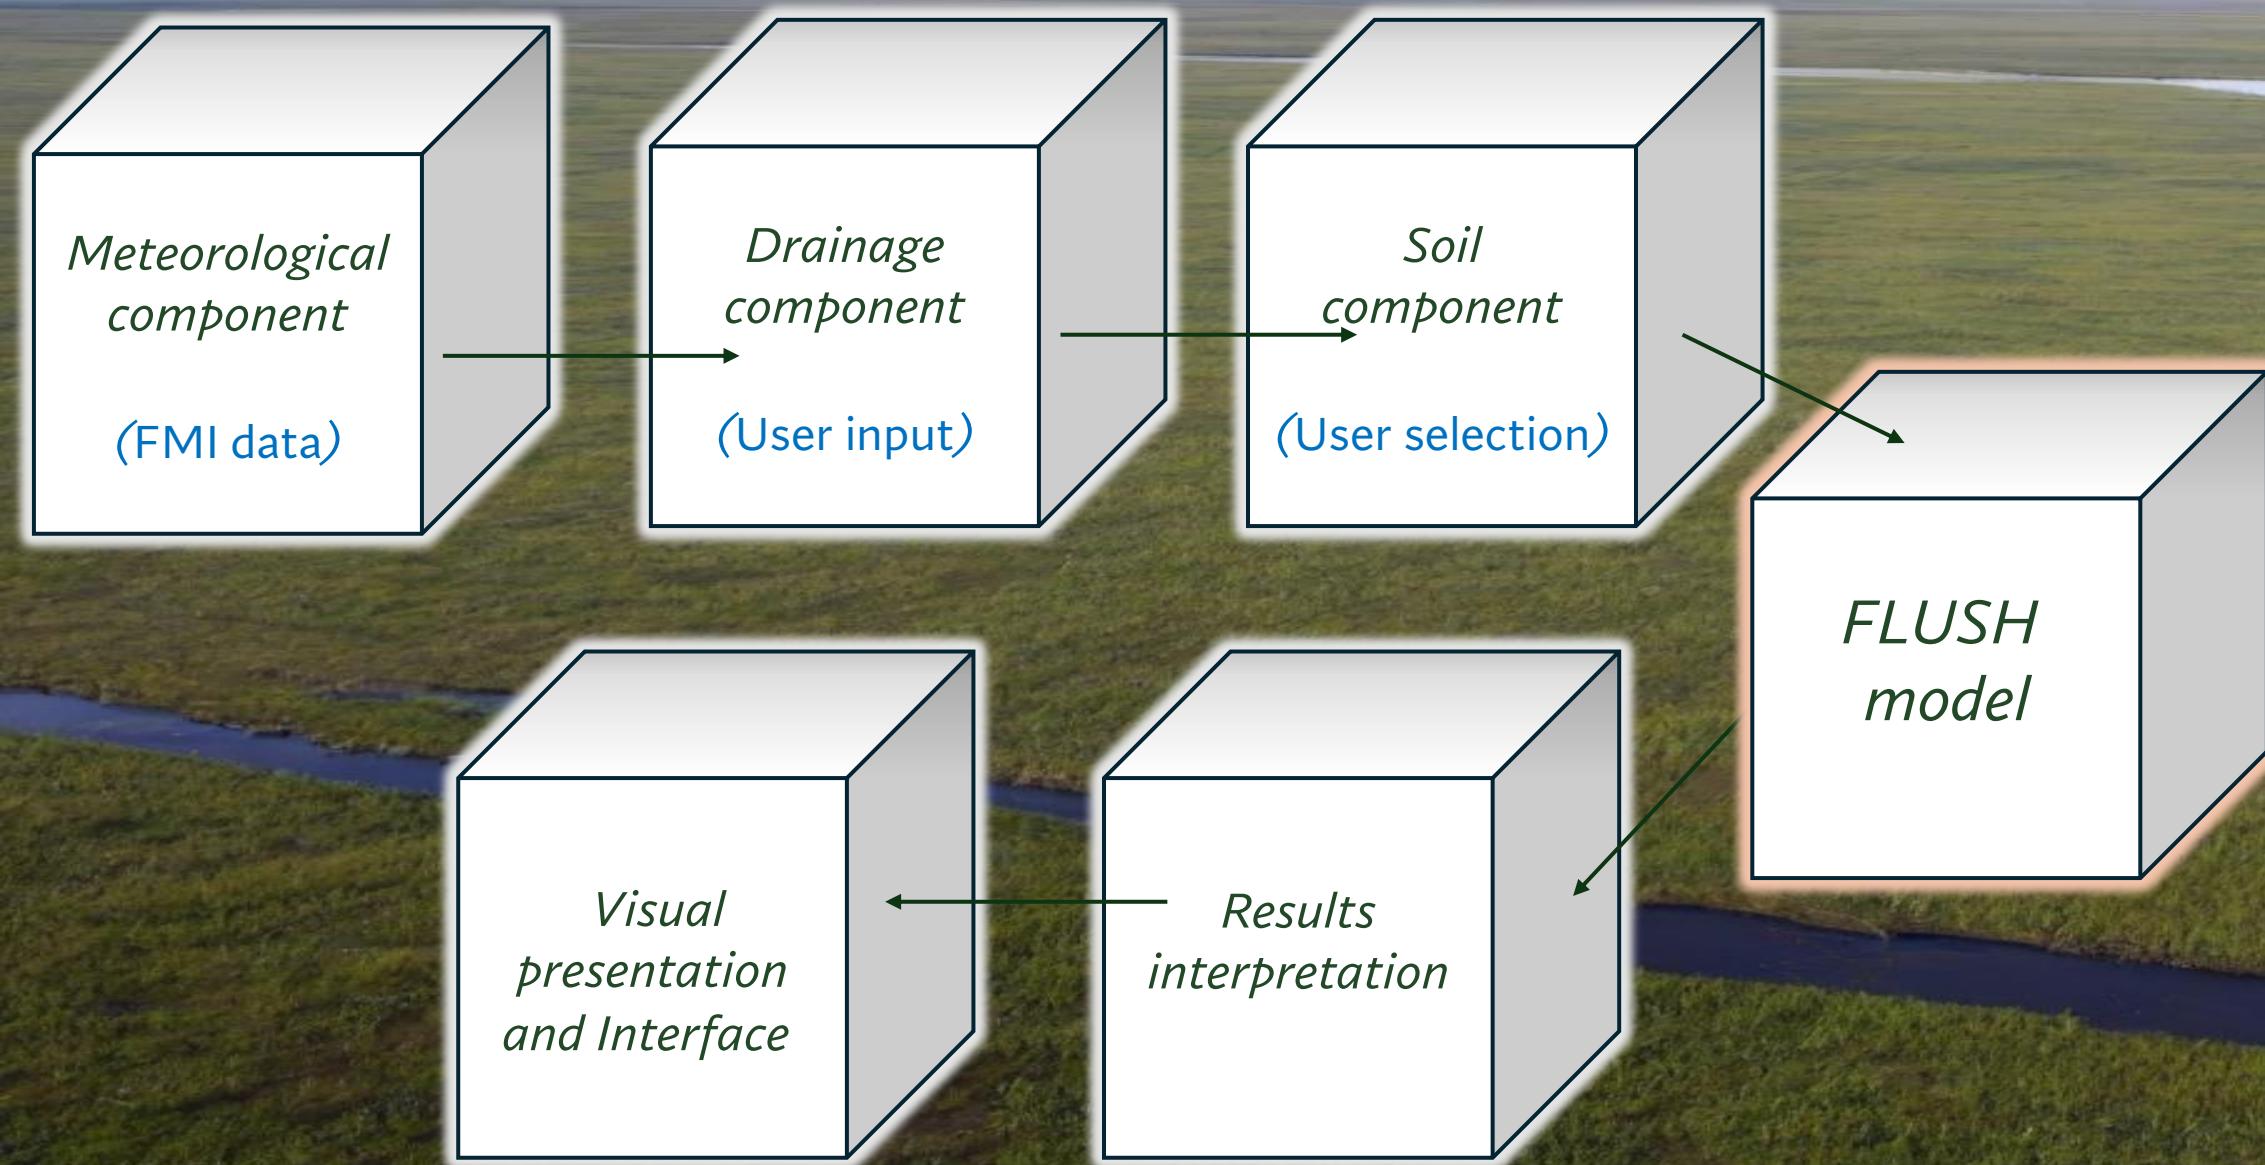

- Desktop tool based on FLUSH hydrological model
- Retrospective modelling (limited by meteorological observations)
- Time frame – 1 year default modelling
- Daily timestep
- Generate user-friendly output plots of:
 - water balance components
 - water level in soil
 - water inflow to ditch/drains
 - snow period

Why?

Produce a **tool** that can be used **for simulating field hydrology at any location in Finland** and for testing possibilities of different drainage options. The tool produces **useful information about field water management** for different end users

How?

Mockup Design

Development of an agricultural field drainage modeling tool

Step 1 Time, Location and Drainage settings

Step 2 Wether data

Step 3 Soil settings

Step 4 Input files

Step 5 Plotting

Modeling year

2012

Tarkasteltava vuosi

Field coordinates
